DAY6: (SPRINT2 COMPLETED)

Reflection:

1. Did your estimations reflect the actual effort?

Our estimations were fairly close to the actual effort required. Most of the smaller stories, such as viewing information or selecting the tournament format, were easier to complete and required fewer story points. However, the Generate Tournament Bracket story was more complex because it involved ranking validation, team seeding, and bracket generation. Overall, the Fibonacci story points helped us get a reasonable idea of the effort required.

2. Was your backlog well-prioritized?

Yes, our backlog was prioritized based on the importance of each feature to the tournament system. We gave higher priority to core functionalities such as team registration, ranking validation, bracket generation, score recording, and updating standings. Less critical features such as viewing general tournament updates were given lower priority. This helped us focus on the main functionality first.

3. How did your simulated sprint align with your plan?

The simulated sprint mostly followed our original plan. In Sprint 1, we focused on the basic tournament setup, including registering teams, managing rankings, selecting the format, and generating the bracket. We then planned Sprint 2 for match management and tournament monitoring. Moving the stories from To Do → In Progress → Done helped us understand how the work would progress during an actual sprint.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart helped us understand how much work was completed and how much work was remaining during the sprint. It showed whether we were progressing at a steady pace or leaving too much work until the end. From the simulation, we understood that our team could handle a limited number of story points in one sprint, so future sprint planning should consider the team's actual capacity rather than taking on too many stories.
